

OPEN PARACHUTE, PBC • 2026

Own your context. Own your AI.

Truly personal computing. Your knowledge belongs with you — an open memory and knowledge layer that any AI can use.

A personal memory and knowledge layer
for *your* data and *your* AI.

Vault	The memory + knowledge layer. Notes, tags, links.
Intelligence	Bring the AI you trust to any vault — over MCP + the open API.
Surface	Custom web interfaces over your data.

Everyone's getting an AI.
Nobody owns the memory.

The shift	AI is finally good enough to be an extension of your mind — but only with your context, and it's only as good as the context you can hand it.
The trap	Your context is scattered across Notion, Obsidian, docs, and chat — and every lab is racing to lock its own memory silo. Not portable, not yours.
The opening	MCP just became the open standard every major lab supports. For the first time, one context layer <i>you</i> own can speak to all of them.

HOW IT'S BUILT & COMPOUNDS

Spin up a vault. Bring your own AI.
The graph compounds.

**Vault**

Your data. Self-host or cloud. REST + MCP.

Intelligence

Your intelligence. Bring the AI you trust.

Surface

Your interface. Bespoke web views over your vault.

Launched in April.
Paying customers, and we run on it ourselves.

Paying	Gitcoin runs its team's knowledge on Parachute — a live paid engagement — alongside paying early customers. The services line is real revenue today , not a projection.
We run on it	Parachute's own roadmap, decisions, meetings, and feedback live in a Parachute vault our AI tends and we govern. Three live vaults — personal, team, org — each prefiguring a product.
Shipping	A full stable release train on June 9 (hub 0.7.0, vault 0.6.0). Five modules, all on npm. Small but growing beta.
Latest · June 9, 2026 — hub 0.7.0 · vault 0.6.0 · scribe 0.5.0 · surface 0.3.0 · runner 0.2.0. All on npm @latest .	

Open source builds trust.
Trust funds two paths.

Hosted	Managed Parachute. Tiered cloud. Open source → trust → pipeline.
Enterprise	Licenses + integration services. AGPL forces companies to share — or buy a commercial license.
Free	Self-host — everything we ship, AGPL, run anywhere
\$2-50/mo	Cloud — managed vault + transcription + AI bundles. Scales with use.
Custom	Org / enterprise — team vaults, private deployments, special licenses, integration services

Owned, or AI-usable.

Until now, *you had to pick one.*

Note apps

Obsidian, Notion — **yours**, but your AI can't fluidly use them, and you keep them up by hand.

AI memory

ChatGPT & co. — the AI **uses** it, but it isn't yours: not portable, opaque, ungoverned.

Parachute

Both. Open, portable, yours — and **governed**: AI proposes, you decide what it remembers. The graph compounds.

WHERE THIS GOES

A substrate that grows with the AI ecosystem around it.

The pendant

Press-and-talk voice capture, straight to your vault. Working prototype.

Custom surfaces

Bespoke UIs at unprecedented speed. The surfaces SDK is live on npm — building one over your vault is a thin import today.

Agents on substrate

AI continuity that survives the model upgrade.

Third-party modules

Calendar, email, knowledge bases — anyone can plug into a Parachute hub.

Pendant prototype — render, PCB, and worn. The gesture-first capture surface for the substrate underneath.

TEAM

Small, capable, committed.

BUILDER

Aaron Gabriel Neyer

Product vision + system architecture.
Ex-Google.

BUILDER

Neil Yarnal

Visual identity, product design, the
look and feel of every surface that
touches a user.

BUILDER

Benjamin Life

Knowledge-management practice and
the bridge between Parachute and the
people building serious second brains.

BUILDER

Jon Bo

Multi-time founding engineer. Tasteful
product architect.

BUILDER

Lucian Hymer

Agentic system wizard. Multi-time
founding engineer.

BUILDER

Marvin Melzer

Elegant hardware craftsman. Pendant
prototype lead, CU ATLAS.

Six of us, mostly part-time, in Boulder — in two months we shipped a four-module open-source stack, and we already run our own company on it. ·
